Who leads - and what the score says

Pressure run contribution, measured against expected runs in late innings.

BATTING LEADER

Rashid Khan

+38.3 runs above expected / 100

23 matches | 148 pressure deliveries
95% range: +7.0 to +62.0

BOWLING LEADER

Yash Dayal

+23.8 runs saved vs expected / 100

10 matches | 76 pressure deliveries
95% range: +8.8 to +39.8

How to read it

BATTER	BOWLER
Positive = more runs than expected.	**Positive = fewer charged runs than expected.**
Score is per 100 pressure deliveries. Rank 1 is the highest in its role.	Separate batting and bowling lists; the scores are not compared across roles.

Leaders at a glance

Batting leaders	Score	Bowling leaders	Score
1. Rashid Khan	+38.3	1. Yash Dayal	+23.8
2. Nicholas Pooran	+34.2	2. Jasprit Bumrah	+23.3
3. Sanju Samson	+33.6	3. Jofra Archer	+22.8

200,999 deliveries | 883 matches | 138 competitions | 80,902 deliveries retained after quality checks.

What this does not establish

The strict margin rule supported too few players for full lists, so the documented late-innings fallback was used. These scores do not measure total player quality or establish 2027 availability, auction prices, roster gaps, or a purchase recommendation.

See pages 2-5 for the formula, full rankings, uncertainty, exclusions and validation limits.

How the score works

1. Find a pressure delivery

Situation	Included when
Chase	60 or fewer legal balls remain AND the required rate is at least 8 runs per over.
First innings	30 or fewer legal balls remain AND at least 3 wickets have fallen.

2. Estimate expected runs

A Ridge model trained on earlier seasons estimates runs for similar match states. Each evaluation year is predicted using earlier data only. The first-innings target reference is the median of earlier complete retained innings.

3. Compare actual with expected

Role	One delivery result
Batter	Batter runs - expected batter runs.
Bowler	Expected charged runs - actual charged runs.

4. Stabilise small samples

SCORE = 100 x total delivery results / (pressure deliveries + 60)

The 60 is a fixed zero-score prior, not 60 observed balls. It pulls small samples toward zero. Example: +18 total runs over expectation on 120 pressure deliveries gives 100 x 18 / (120 + 60) = +10 score units per 100.

Evidence and role labels

Each ranked player has at least 30 pressure deliveries across 5 matches. The 95% range resamples whole matches; if it crosses zero, the estimate is not clearly separated from zero. The year selector has no separate annual interval. Role labels require 60 role events across 5 matches. "Death overs" is batting-phase evidence; multiple batting tags do not mean all-rounder status. Bowling phase tags describe bowling only.

Wickets are reported separately and are not given an unvalidated run value in the ranked score.

Top 10 batters

Highest score first. Each score is per 100 eligible pressure deliveries and is shown with its match sample and 95% range.

Rank / player	Observed role evidence	Score	Matches / deliveries	95% range
1. Rashid Khan	Death overs	+38.3	23 / 148	+7.0 to +62.0
2. Nicholas Pooran	Middle order, Death overs	+34.2	7 / 69	-15.6 to +77.6
3. Sanju Samson	Opener, Middle order	+33.6	8 / 59	+2.1 to +67.9
4. Azmatullah Omarzai	Middle order, Death overs	+33.2	12 / 137	-0.1 to +66.6
5. Suryakumar Yadav	Middle order, Death overs	+33.0	13 / 110	+11.2 to +58.1
6. Shubman Gill	Opener, Death overs	+30.8	8 / 80	+7.6 to +51.3
7. Shashank Singh	Death overs	+29.8	11 / 174	+3.3 to +52.5
8. Sikandar Raza	Middle order	+24.8	10 / 132	+1.4 to +40.1
9. George Linde	Not established	+24.2	5 / 47	-2.4 to +60.6
10. Josh Inglis	Middle order	+24.2	5 / 31	+4.1 to +34.9

These tags are inferred from supplied batting position and phase exposure. A missing role means the sample did not meet the role evidence rule; it does not mean the player cannot perform that role.

Top 10 bowlers

Highest score first. Each score is per 100 eligible pressure deliveries and is shown with its match sample and 95% range.

Rank / player	Observed role evidence	Score	Matches / deliveries	95% range
1. Yash Dayal	Death, Middle overs, Powerplay	+23.8	10 / 76	+8.8 to +39.8
2. Jasprit Bumrah	Death, Middle overs, Powerplay	+23.3	22 / 253	+5.8 to +42.3
3. Jofra Archer	Death, Middle overs, Powerplay	+22.8	14 / 111	+5.5 to +40.5
4. Shaheen Afridi	Death, Middle overs, Powerplay	+21.1	16 / 127	+6.4 to +35.5
5. Sunil Narine	Middle overs	+19.8	10 / 90	+5.9 to +31.9
6. Shardul Thakur	Death, Middle overs, Powerplay	+19.4	7 / 89	+15.7 to +23.1
7. Axar Patel	Middle overs, Powerplay	+18.8	14 / 105	-6.6 to +40.1
8. Sufiyan Muqeem	Middle overs	+16.5	8 / 104	-5.3 to +36.5
9. Mustafizur Rahman	Death, Middle overs, Powerplay	+15.2	22 / 260	+1.0 to +29.3
10. Matheesha Pathirana	Death, Middle overs	+14.9	18 / 293	+2.7 to +29.0

Bowling phases use legal balls 1-36, 37-90 and 91-120. The score still ranks contextual charged-run contribution; phase tags describe observed overs, not a player biography.

Data quality and limits

The supplied pack covers 2022-01-22 to 2026-11-01. Of 883 matches and 200,999 deliveries, 345 matches and 80,902 deliveries were retained. The pack spans 138 competitions; performance transfer between competitions is not validated.

Why records were excluded

Reason	Matches affected
ambiguous extras semantics / penalty timing	486
abandoned / tied / eliminator	46
revised length or target timing unknown	34
incomplete or inconsistent regulation innings	24
missing regulation innings	22
nonterminal chase	17
winner reconciliation failed	9
super over	6
untyped extras	2
over has more than six inferred legal deliveries	1

Exclusion counts overlap and must not be added. Out-of-time evaluation used 271 matches and 63,226 deliveries; other retained deliveries were warm-up or training-only. Ambiguous extras are the largest exclusion and may affect which matches are represented.

What was checked

Separate task-model check	Brier (lower is better)	Log loss (lower is better)
2026 later-match set (53 matches)	Linear logistic: 0.135	Linear: 0.412
Alternative model, same test	Quadratic: 0.138	Quadratic: 0.424

This check evaluates the match-state task model, not whether a player ranking predicts future performance. The 2026 set was inspected during this work, so it is not a prospectively sealed test.

Not established by these data

No psychological pressure ground truth, validated combined wicket-and-run score, venue adjustment, 2027 availability, auction price or verified roster gap. The lists are statistical findings from the supplied multi-competition data, not auction targets.
