ROYALS' RESOLVE

Pressure Calculation

A short guide to what the score means, how it is calculated, and what the data can support.

Analysis b4f0c8fbe6ff7350 | Data: 2022-01-22 to 2026-11-01

200,999 supplied deliveries across 883 matches. The report uses a smaller retained sample after the documented exclusions.

These lists describe contextual runs in selected situations. They are not a measure of total player quality and are not auction recommendations.

How to read the score

First, compare the score with zero. A positive batting score means more batter runs than the model expected. A positive bowling score means fewer charged runs than expected. Higher is better within the same role; batting and bowling scores should not be compared with each other.

The zero line means a player scored exactly what the expected-runs model predicted for the pressure deliveries. Each player result is pulled partway toward zero so a small sample does not dominate the ranking.

The calculation

Step	Plain-language calculation
1. Expected runs	Use earlier seasons to estimate runs for similar match situations.
2. Delivery result	Batting: batter runs minus expected runs. Bowling: expected charged runs minus actual charged runs.
3. Player score	100 x total delivery result / (pressure deliveries + 60).

Example: 120 pressure deliveries produced 18 more runs than expected. The score is 100 x 18 / (120 + 60) = +10 runs per 100 pressure deliveries.

What counts as a pressure situation?

Chase: 60 or fewer legal balls remain and the required rate is at least 8 runs per over. First innings: 30 or fewer legal balls remain and at least 3 wickets have fallen. The strict margin rule did not find enough eligible players for both lists, so this stated fallback is used for both roles.

A player needs at least 30 pressure deliveries across 5 matches. The 95% range resamples whole matches; if it crosses zero, the evidence does not clearly separate the score from zero. Wickets are reported separately and are not assigned an unvalidated run value.

Top 10 batters

Ordered from highest to lowest batting score. Each estimate is shown with its sample and 95% range.

Rank / player	Observed role evidence	Score / 100	Matches	95% range
1. Rashid Khan	Death overs	+38.3	23	+7.0 to +62.0
2. Nicholas Pooran	Middle order, Death overs	+34.2	7	-15.6 to +77.6
3. Sanju Samson	Opener, Middle order	+33.6	8	+2.1 to +67.9
4. Azmatullah Omarzai	Middle order, Death overs	+33.2	12	-0.1 to +66.6
5. Suryakumar Yadav	Middle order, Death overs	+33.0	13	+11.2 to +58.1
6. Shubman Gill	Opener, Death overs	+30.8	8	+7.6 to +51.3
7. Shashank Singh	Death overs	+29.8	11	+3.3 to +52.5
8. Sikandar Raza	Middle order	+24.8	10	+1.4 to +40.1
9. George Linde	Not established	+24.2	5	-2.4 to +60.6
10. Josh Inglis	Middle order	+24.2	5	+4.1 to +34.9

Role labels need 60 role events across 5 matches. Batting roles come from recorded batting order or actual late-innings batting exposure; bowlers' phase labels describe bowling only. A player may have evidence for more than one batting role.

Top 10 bowlers

Ordered from highest to lowest bowling score. Each estimate is shown with its sample and 95% range.

Rank / player	Observed role evidence	Score / 100	Matches	95% range
1. Yash Dayal	Death, Middle overs, Powerplay	+23.8	10	+8.8 to +39.8
2. Jasprit Bumrah	Death, Middle overs, Powerplay	+23.3	22	+5.8 to +42.3
3. Jofra Archer	Death, Middle overs, Powerplay	+22.8	14	+5.5 to +40.5
4. Shaheen Afridi	Death, Middle overs, Powerplay	+21.1	16	+6.4 to +35.5
5. Sunil Narine	Middle overs	+19.8	10	+5.9 to +31.9
6. Shardul Thakur	Death, Middle overs, Powerplay	+19.4	7	+15.7 to +23.1
7. Axar Patel	Middle overs, Powerplay	+18.8	14	-6.6 to +40.1
8. Sufiyan Muqeem	Middle overs	+16.5	8	-5.3 to +36.5
9. Mustafizur Rahman	Death, Middle overs, Powerplay	+15.2	22	+1.0 to +29.3
10. Matheesha Pathirana	Death, Middle overs	+14.9	18	+2.7 to +29.0

Role labels need 60 role events across 5 matches. Batting roles come from recorded batting order or actual late-innings batting exposure; bowlers' phase labels describe bowling only. A player may have evidence for more than one batting role.

Data, checks and limits

The source pack contains 200,999 deliveries and 883 matches. 80,902 deliveries from 345 matches were retained for this analysis; 120,097 deliveries were excluded under the documented data-quality rules.

Why matches were excluded

Reason	Matches affected
ambiguous extras semantics / penalty timing	486
incomplete or inconsistent regulation innings	24
nonterminal chase	17
missing regulation innings	22
revised length or target timing unknown	34
abandoned / tied / eliminator	46
untyped extras	2
winner reconciliation failed	9
super over	6
over has more than six inferred legal deliveries	1

Exclusion reasons can overlap, so match counts in this table should not be added together.

What the checks can and cannot say

Expected runs are estimated from earlier seasons and evaluated on later matches. Match-bootstrap ranges describe uncertainty in the player average, conditional on that expected-runs model; they do not include every source of model uncertainty. The 2026 check was not a prospectively sealed test.

The data does not validate a combined wicket-and-run score, venue adjustment, auction price, 2027 availability, or a psychological measure of pressure. Missing evidence is not treated as poor ability. Verify official squad and auction information separately before making decisions.
